

Ideal for total health systems support

Health informatics training courses

Ideal provides flexible health informatics training solutions to healthcare organisations, to enable the development of skills for all staff involved in managing, planning, implementing, supporting or using health systems.

Developing in house capability

At Ideal, we work with our clients to identify any specific skills gaps and then resolve any shortfalls through the delivery of the relevant training solutions.

Our training delivers long term internal capability whilst also supporting the immediate goals and targets of each organisation. This can prepare staff for the demands and challenges of rapid business change within the NHS.

Professional trainers

Training is delivered by our experienced, professional trainers who are experts in their subject area. They are extremely effective communicators and can contribute valuable and practical health informatics experience.

Tailored training courses

All our courses are designed specifically for the healthcare sector. Many individual elements of our training courses can be customised to suit either the requirements of a particular audience or to meet the specific skills gap at any phase of a project.
